04/01/2019 8:00 PM Stakeholder Conference Call

Summary of day's events by IC David Wascome:

Benzene levels have decreased a lot today. We're in the tank farm and working.

We made good progress skimming the ship channel today and we're making progress on Tucker Bayou.

We have or will soon complete the vacuum and rinse of 80-14 and the same for 80-15 later tonight hopefully. We're using Z500 microbead to rinse the tanks.

Next we'll move to 80-10 and then 80-7 tomorrow. Those are the pygas tanks – those are our priority and the benzene levels should decrease a lot after we have those tanks drained and rinsed. We'll try to move east to west in the tank farm. Other tanks in the tank farm are 2 empty tanks, 3 with gas blend stock, and naphtha, xylene and toluene.

We're going to move east to west and try to get Independence Parkway opened up to commercial traffic as soon as possible. The benzene levels along Independence Parkway should be low enough tomorrow for Center Point Energy to be able to get in there and get power back up for the neighboring sites without power right now.
